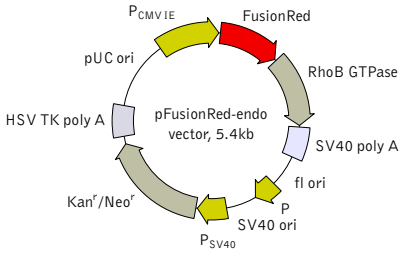
pFusionRed-endo vector

The vector sequence has been compiled using the information from sequence databases, published literature, and other sources, together with partial sequences obtained by Evrogen. This vector has not been completely sequenced.



For vector sequence, please visit our Web site at http://www.evrogen.com/products/vectors.shtml

Product	Cat.#	Size
pFusionRed-endo vector	**FP427**	20 μg

Vector type	mammalian expression vector
Reporter	FusionRed
Reporter codon usage	mammalian
Promoter for FusionRed	$P_{CMV\ IE}$
Host cells	mammalian
Selection	prokaryotic - kanamycin eukaryotic - neomycin (G418)
Replication	prokaryotic - pUC ori eukaryotic - SV40 ori
Use	red fluorescent labeling of vesicles of the endocytic pathway

Location of features

$P_{CMV\ IE}$: 1-589
Enhancer region: 59-465
TATA box: 554-560
Transcription start point: 583
FusionRed-Human RhoB GTPase fusion
Start codon (ATG): 613-615
Start of FusionRed coding sequence (ATG): 613-615
Last amino asid in FusionRed: 1306-1308
c-Myc epitope: 1363-1395
Human RhoB GTPase: 1399-1977
Stop codon: 1975-1977
SV40 early mRNA polyadenylation signal
Polyadenylation signals: 2169-2174 & 2198-2203
mRNA 3' ends: 2207 & 2219
f1 single-strand DNA origin: 2266-2721
Bacterial promoter for expression of Kan^r gene
-35 region: 2783-2788; -10 region: 2806-2811
Transcription start point: 2818
SV40 origin of replication: 3062-3197
SV40 early promoter
Enhancer (72-bp tandem repeats): 2895-2966 & 2967-3038
21-bp repeats: 3042-3062, 3063-3083 & 3085-3105
Early promoter element: 3118-3124
Major transcription start points: 3114, 3152, 3158 & 3163
Kanamycin/neomycin resistance gene
Neomycin phosphotransferase coding sequences:
Start codon (ATG): 3246-3248; Stop codon: 4038-4040
G->A mutation to remove Pst I site: 3428
C->A (Arg to Ser) mutation to remove BssH II site: 3774
Herpes simplex virus (HSV) thymidine kinase (TK) polyadenylation signal
Polyadenylation signals: 4276-4281 & 4289-4294
pUC plasmid replication origin: 4625-5268

Vector description

pFusionRed-endo is a mammalian expression vector intended for red fluorescent labeling of vesicles of the endocytic pathway [Adamson et al. 1992], allowing the monitoring of intracellular membrane traffic during endocytosis in living cells. The vector encodes red fluorescent protein FusionRed targeted to endosomes by human RhoB GTPase fused to the FusionRed C-terminus. The fusion also contains c-Myc epitope tag.

FusionRed codon usage is optimized for high expression in mammalian cells (humanized) [Haas et al. 1996].

pFusionRed-endo vector can be used as a source of FusionRed-RhoB hybrid sequence. The vector backbone contains unique restriction sites that permit its excision and further insertion into expression vector of choice.

Note: The plasmid DNA was isolated from dam^+-methylated *E.coli*. Therefore some restriction sites are blocked by methylation. If you wish to digest the vector using such sites you will need to transform the vector into a dam^- host and make fresh DNA.

The vector backbone contains immediate early promoter of cytomegalovirus ($P_{CMV\ IE}$) for protein expression, SV40 origin for replication in mammalian cells expressing SV40 T-antigen, pUC origin of replication for propagation in *E. coli*, and f1 origin for single-stranded DNA production. SV40 polyadenylation signals (SV40 poly A) direct proper processing of the 3'-end of the reporter mRNA.

SV40 early promoter (P_{SV40}) provides neomycin resistance gene (Neo^r) expression to select stably transfected eukaryotic cells using G418. Bacterial promoter (P) provides kanamycin resistance gene expression (Kan^r) in *E. coli*. Kan^r/Neo^r gene is linked with herpes simplex virus (HSV) thymidine kinase (TK) polyadenylation signals.

Expression in mammalian cells

pFusionRed-endo vector can be transfected into mammalian cells by any known transfection method. CMV promoter provides strong, constitutive expression of the FusionRed-RhoB fusion in eukaryotic cells. If required, stable transformants can be selected using G418 [Gorman 1985].

Propagation in *E. coli*

Suitable host strains for propagation in *E. coli* include DH5alpha, HB101, XL1-Blue, and other general purpose strains. Plasmid incompatibility group is pMB1/ColE1. The vector confers resistance to kanamycin (30 μg/ml) to *E. coli* hosts. Copy number in *E. coli* is about 500.
